

Equip Your Organization for a Data-driven Future in Post-Acute Care (PAC) and Stay Ahead of the Curve

Is your organization facing data challenges?

- We know your organization faces challenges when important data is stuck in another system and hard to access.
- When information is not readily available, it can affect your metrics, reimbursement, costs, and most importantly, patient care and outcomes.

The Post-Acute Care InterOperability (PACIO) Project can help your organization thrive

- PACIO can help your organization **address challenges** via **free, publicly available, and tested Fast Healthcare Interoperability Resource (FHIR®) Implementation Guides (IGs)**: Advance Healthcare Directive Interoperability, Personal Functioning and Engagement, Standardized Medication Profile, and Transition of Care.
- To support your organization's provision of high-quality care, IGs **standardize key post-acute care data**, including functional/cognitive status, advance directives, and medication information collected in various care settings and exchanged during care transitions.
- All IGs **are developed in collaboration with medical and technical experts** across healthcare, industry, government, and other sector partners and is **funded by CMS**.

Engage with PACIO today!

Your organization can support PAC health data exchange via:

- **Recommending staff** to join PACIO for solution development.
- **Participating in Connectathons** where cross-sector partners meet to test PACIO and other data-sharing solutions.
- **Testing/piloting solutions** in your own organization's systems.

By utilizing the PACIO FHIR Implementation Guides and collaborating with PACIO, your organization can access the data it needs today.

PACIO Project
